

Controller Installation

EcoWise Irrigation LLC

Upgrade your irrigation system with a new controller

What it is

Upgrade your irrigation system with a professional controller installation by replacing an aging or inefficient timer with a modern smart controller to optimize watering schedules, reduce water waste, and protects your lawn and landscaping year-round.

What it involves

What happens when we install a controller.

- Safe disconnection, labeling of existing zone wires, and removal of old hardware
- Secure mounting of the new controller unit and connection to power source.
- Wiring of the Common (C), Master Valve/Pump Start (if applicable), and individual Zone terminals with proper wire management.
- Pairing smart controllers to your local 2.4 GHz network, setting up mobile app access, and setting initial custom schedules.
- Installation of Rain/Moisture Sensor for automated weather shutoff. *
- Zone-by-zone activation test to verify valve operation and ensure proper flow across all irrigation zones.

*** New Installations:** Every new automatically controlled landscape irrigation system must include a rain or moisture sensor or equivalent shutdown technology.

Controller Replacements: If you repair an existing system by replacing the controller, you must install a rain/moisture sensor or shut-off technology at that time.

Pricing

Pricing for this service is set at the standard hourly rate* plus cost of the Controller and Sensors**

*Hourly rate is \$100 per hour with a 1 hour minimum.

**If the homeowner purchases the controller or sensor themselves then EcoWise Irrigation will only provide the installation warranty, any issues with the hardware will have to be dealt with between the homeowner and retailer.

If the homeowner purchases the controller or sensor through EcoWise Irrigation then we will provide both the hardware and installation warranty.
